Project Title

Incident Escalation & On-Call Rotation Engine

Problem Statement

A DevOps on-call management system that organizes team shift rotations, routes monitoring alerts through multi-tiered phone/SMS escalation ladders, and tracks incident post-mortems.

ID	Type	Description	Priority	Acceptance Criteria	Rationale
FR-001	Functional	System shall ingest incident alerts and create an incident record.	High	Pass: valid alert creates incident. Fail: alert received but no incident created.	Starts the incident management process.
FR-002	Functional	System shall identify the active on-call engineer from the rotation schedule.	High	Pass: correct active engineer identified. Fail: incorrect/inactive engineer assigned.	Ensures incidents reach the responsible engineer.
FR-003	Functional	System shall escalate an incident to the secondary engineer if the primary does not	High	Pass: escalation occurs after 5 minutes. Fail: incident remains	Prevents incidents from remaining unattended.

		acknowledge within 5 minutes.		unacknowledged without escalation.	
FR-004	Functional	System shall send notifications through configured channels including SMS and phone-based escalation.	High	Pass: engineer receives notification. Fail: notification is not dispatched.	Supports multi-tier incident escalation.
FR-005	Functional	System shall record and track post-mortem information for resolved incidents.	Medium	Pass: post-mortem can be recorded/retrieved. Fail: information cannot be recorded/retrieved.	Supports incident review after resolution.
NFR-001	Performance	Alert dispatch through webhook, SMS and email shall initiate within 3 seconds of alert ingestion.	High	Pass: dispatch begins within 3 seconds. Fail: takes more than 3 seconds.	Enables rapid incident response.
NFR-002	Security	System shall allow incident and on-call information to be accessed only by authorized users and services.	High	Pass: authorized access succeeds and unauthorized access is denied. Fail: unauthorized access succeeds.	Protects sensitive incident and on-call information.

Requirement Summary :

Total Functional Requirements: 5

Total Non-Functional Requirements: 2

High Priority Requirements: 6

Medium Priority Requirements: 1
